Métraux Transports, Savigny

SHORT DESCRIPTION

This building is located in the municipality of Savigny within the perimeter of the "PPA la Claie aux Moines 2" land-use plan and borders on the Claie aux Moines cantonal road.

THE PROJECT

The two interlocking volumes offer an efficient internal division between offices and workshops, with each function retaining its own autonomy. The continuous openings of the workshop allow good management of the numerous vehicles located there. The steel-framed hall rests on a reinforced concrete foundation, while the office part is made of brick and concrete. The facades are clad with metal cladding made of ribbed sheet metal and mineral wool insulation, while the workshop is clad with sandwich sheet metal. The roof and spring water is collected in a buffer tank and used in the truck cleaning system. The wash water is treated before being discharged into the sewage system.

SERVICES IN DETAIL

The site has been used by Métraux Transports for many years. The new building adds a modern hall with a mechanical workshop and offices to the existing facilities. It offers a mix between the areas for activities related to vehicle maintenance: repair workshops, truck wash, diagnostic area and logistics area: offices and administration.

Building volume: 9'656^{m3}
